DETAILED ACTION

Allowable Subject Matter

Claims 1-11 are allowed.

The following is an examiner's statement of reasons for allowance: prior art, U.S. Patents # U.S. Patent # 6,359,517 B1 of Colaco and # 4,574,249 of Williams, do not teach nor render obvious a transimpedance amplifier that has, in combination with other limitations, a second circuit that is driven by the low frequency component of the output signal and is connected with the forward transimpedance circuit such that the impedance of the second circuit presented at the amplifier input decreases as the output signal increases, the second circuit including a first pnp transistor having a first base terminal and a first emitter terminal, wherein the first emitter terminal is connected to the amplifier input; and a second pnp transistor having a second base terminal, the second base terminal being connected to the first base terminal, the second pnp transistor having an emitter size that is some factor smaller than an emitter size of the first pnp transistor; neither does it have variable impedance circuitry wherein an impedance of the variable impedance circuitry is dependent on an average current of the input current signal such that the impedance decreases as the average current increases and wherein a low cutoff frequency of the transimpedance amplifier decreases when the average current increases to greater than a specified threshold, the variable impedance circuitry including a first pnp transistor having a first base terminal and a first emitter terminal, wherein the emitter terminal is connected to the

Art Unit: 2817

amplifier input, the first pnp transistor have a first emitter size; and a second pnp transistor having a second base terminal, the second base terminal being connected to the first base terminal, the second pnp transistor having a second emitter size that is some factor smaller than the first emitter size; neither does it have a system that has a first pnp transistor, and a second pnp transistor, the first pnp transistor having a first base terminal and a first emitter size, the second pnp transistor having a second base terminal, the second base terminal being connected to the first base terminal, the second pnp transistor having a second emitter size that is some factor smaller than the first emitter size, and a method for controlling a low cutoff frequency as average input current to the system increases, the method having the step of utilizing the first and second pnp transistors to control the low cutoff frequency such that the low cutoff frequency transitions to decreasing when the magnitude of average input current reaches a specified threshold.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. U.S. Patents # 6,359,517 B1, # 4,574,249, # 6,069,534, # 5,304,793, # 5,606,277 contain some limitations of the claimed invention.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
